

*Santa Clara*

December 30, 1970

A meeting was held December 30, 1970, in the City Offices to discuss with the Ivins Waterusers water conditions and situations connected with the Ivins Reservoir. Present were Charles Hafen, Weston Hafen, Donald Best, Kay Ence, Reed Mathis, Wilford Holt, and Rudger McArthur.

The following conclusions were reached:

1. All water in the Santa Clara River in the location of the Gunlock Dam will, of necessity, be stopped at that point.
2. The high-water allocated to the Ivins Irrigation Company so impounded will be released for a like number of hours in a volume equal to the capacity of their canal. High-water over and above the capacity of the canal becomes storage water in the Reservoir not subject to recall by the Ivins Irrigation Company. The release of said high-water will be immediately following the date of impoundment in the Gunlock Reservoir.
3. The storage right decreed to Ivins of 1,000 acre feet will be stopped at the Gunlock Dam and released to the Ivins Irrigation Company upon their request in a stream equal to the capacity of their canal. The first 500 acre feet of storage water will be released to Ivins without a storage fee. The second 500 acre feet will be charged a storage fee of not to exceed \$4.00 per acre foot.
4. The gauging station at the Gunlock Bridge will be the point of determination as to the quantity of water in storage to be released as storage water or high-water. The quantity of water to be released will be reduced by the amount of water entering the River below the Gunlock Dam and above the Shem Dam that is available to be stored in the Ivins Reservoir. All water so stored and released is subject to an appropriate reduction for evaporation and seepage.
5. Adequate measuring and recording devices will be installed at the Ivins diversion at the Shem Dam. Water released for Ivins Bench use will be released by the Water Commissioner on the Santa Clara River.
